office: Civil Engineering Building (H20), Level 6, Room CE614

INFORMATION ABOUT THE COURSE

The aim of this course is to introduce students to the concepts and techniques involved in structural dynamics and their practical applications in structural engineering. The course begins with an introduction of the dynamics of simple structures and then develops the fundamental knowledge of vibration analysis of multi-degree-of-freedom structures and continuous structures. Students will develop an understanding of the nature of dynamic loads produced by various sources including earthquakes and acquire the ability to assess the response of civil engineering structures to such loads. The material covered in this course is essential to the analysis and design of large-scale structures such as multi-story buildings, towers and long-span bridges that are susceptible to vibration. Much of the knowledge acquired in this subject is also applicable to dynamic problems in other areas such as geotechnical engineering, mechanical engineering and material science.

relevant problems, a major assignment, that challenges your engineering abilities and a final exam. Further details are provided in the Assessment section.

TEACHING STRATEGIES

This subject consists of a mixture of lectures, workshops, and laboratory sessions.

Lectures will cover the basic theories of structural dynamics and its applications to structural engineering. Application of the theories to formulate guidelines in the analysis of practical engineering problems will be emphasized.

The workshops provide you with the opportunity to discuss the lecture material with your demonstrators and to solve the set exercise problems. To understand the subject matter well, it is essential to attend the

ASSESSMENT

The assessment of this course will be based on two comprehensive quizzes, one assignment and a final exam. The final grade will be based on the sum of the scores from each of the assessment tasks. The lecturer reserves the right to adjust the final scores by scaling.

Two in-class quizzes are scheduled for Weeks 4 and 8, respectively. They will be online and open book. The duration of the quizzes is 60 minutes. The quizzes will be held under exam conditions. The purpose of the quizzes is to test your understanding of the fundamental concepts and your ability to apply learned strategies to relevant problems.

One assignment is to be submitted in Week 10. The purpose of the assignment is to expose you to a realistic structural dynamics problem, which requires you to apply what you have learned. Similar to engineering practice, this will require you to find additional information by asking, reading or discussing with your classmates, to critically evaluate your model and to formulate conclusions. Here, documentation is equally important as results. It is expected that you submit a report that is similar in scope, form, and style to what you would submit to a private or public client who has commissioned you with the dynamic analysis.

A mark of at least 40% in the final examination is required before the class work is included in the final mark. The formal exam scripts will not be returned.

Students who perform poorly in the in-class quizzes and workshops are recommended to discuss progress with the lecturer during the semester.

Details of each assessment component, the marks assigned to it, the criteria by which marks will be assigned, and the dates of submission are set out below.

Supplementary Examinations for Term 3 2020 will be held on Monday 11th January Friday 15th January 2021 (inclusive) should you be required to sit one. You are required to be available during these dates. Please do not to make any personal or travel arrangements during this period.

PENALTIES

Late submissions of the assignment will be penalised at the rate of 25% of the maximum achievable mark per day after the due time and date have expired. Submissions that are more than 4 days late (unless special considerations have been granted) are not accepted and 0 marks are awarded.

Late submissions of the quiz paper will be penalised by 25% of the maximum achievable mark per 5min and are not accepted after 15+ min past the due date and time.

ASSESSMENT OVERVIEW

Item	Length	Weighting	Learning outcomes assessed	Assessment Criteria	Due date and submission requirements	Deadline for absolute fail	Marks returned
1.Quizzes					·	•	
Quiz 1	45 min	10%		Application of taught concepts on SDOF systems	Week 4	Week 4	Week 4
Quiz 2	45 min	10%		Application of taught concepts on MDOF systems	Week 8	Week 8	Week 8
2. Assignment
